TECHNICAL CHARACTERISTICS SIZES 56 - 132

Motive motors are built according to international standard regulations; each size throughout the construction forms is calculated with reference to the tables of standard IEC 72-1.

Motive asynchronous three-phase delphi series motors are closed, and externally ventilated. The frame, up to 132 included, is made in die casting aluminium alloy, from size 160 up to 355 the frame is made in cast iron.

All DELPHI motors are three-phase, multiple voltage multi-frequency 50/60Hz, F class insulation, (H+ on request) S1 continuous duty service, IP55 protection (IP56, 66 and 67 on request) IE2, IE3 or IE4 efficiency class tropicalized winding suitable for inverter power supply

IE2, high efficiency class IEC 60034-30-1 IE3, premium efficiency class IEC 60034-30-1 IE4, super premium efficiency class IEC 60034-30-1

Download from www.motive.it the catalogue of 1PH motors "MONO" series

REGISTERED DESIGN

Bearings selected for their silence and reliability and, for the same objectives, the cage rotor is dynamically balanced.

All three-phase Delphi motors, from size 56 to size 355, standard, ATEX, or brake motors, are covered by the international type approval certification for marine use issued by RINA.

RI

From type 90, a steel insert is provided in the bearing slot of the aluminum flanges, to resist to radial mechanical forces with a fair degree of security

The copper is impregnated with a double layer of H class

and mechanical stress.

an inverter.

insulating enamel to ensure high

resistance to electrical, thermal

The phases are further isolated

voltage peaks that usually occur

when the motor is controlled by

by another layer of Nomex film to protect the motors from the

Aiming the maximum protection, the motors are equipped with important details like the pull-resistant cable gland and the combination of bearings with two shields each with rubber seal rings

Cable gland can be easily moved on both the sides of the connection box, thanks to the screw cap

The connection box can be rotated of 360° with steps of 90°

To protect them by the rust, motive motors are painted in silver RAL9006 colour

Performance excellence is granted by the low loss CRNO "FeV" magnetic laminations adoption,instead then the usual Semi Processed/Decarb "FePO1". FeV laminations provide higher efficiency, lower heating, energy saving and longer life to insulation materials

Very thick and made of a special plastic material, the fan cover is:

- impact resistant
- soundproofing
- scratchproof
- rustproof

motive

3 41/1 90

MADE IN ITALY

From size 56 to size 132, feet are detachable, and can be fixed on 3 sides of the housing, thus permittig the terminal box to be positioned up, right or left.

TECHNICAL CHARACTERISTICS SIZES 160-355

Motive three phase motors from size 160 up to size 355 are made in castiron and have all those main features of the Delphi series, among which:

- standardized dimensions according to International standards (IEC 72-1)
- multiple voltage and multi-frequency 50/60Hz,
- F class insulation, [oupon request H or H+ (delfire)]
- S1 continuous duty service,
- IP55 protection (IP56, 66 and 67 on request)
- tropicalized winding and reinforced insulation
- suitable for inverter power supply* [from 110kW and up we recommend to order the motor with insulated barings (option)]

IE2, high efficiency class IEC 60034-30-1

IE3, premium efficiency class IEC 60034-30-1 IE4, super premium efficiency class IEC 60034-30-1

Keeping the same sealing system of the whole delphi series, the terminal box up to size 280 is made in aluminum, thus guaranteeing its IP65 protection index without being affected by the usual finishing imperfections of the cast iron

From size 160 up to 280, we mount ZZ auto-lubricated bearings, thus avoiding the need of a periodical re-greasing maintenance

Instead, from size 315 and up, they are provided with lubricators. 4, 6 and 8 poles motors drive end bearings are in fact of open roller type, in order to withstand eventual extraordinary radial loads (see paragraph "components list")

Upon request, motive can anyway mount the terminal box laterally, on the right or the left

provided with 3 PTC

protect the motor and

the system by operation

thermistors that

anomalies

equipped by lifting eyebolts [one for B3 version (feet fixing), two for B5 version (flange fixing)]

The terminal

box can be

rotated of

 360° with steps of 90°

Given the high torque, the fixing is ensured by feet integrally casted with the housing

DELFIRE SERIES, 100°C RESISTANT MOTORS

The used technology finds its origin in EN 12101-3 fire emergency motors for smoke evacuation, but instead of being intended for working for few hours only, it is designed to offer an S1 continuous duty service and the same lifespam of a normal motor in a normal ambient. The main features are:

• metal cable glands and ventilation, viton gaskets and seals, high temp bearings, steel bearing seats

- defluxed winding for a low temp rise, dual coated magnet wires, increased H class:
- Double impregnation: varnished twice and re-baked. The process assures the coverage of pin holes. The increased solid content layer increases the high voltage capacity of the motor and better protects it against surge voltages. The increased parasitic capacitance gives a higher impulse withstand capacity;
- Gel Coat: the stator is then further protected by an epoxy compound which cures fast under hot conditions. Epoxy has very good fungus resistance properties, thus avoiding tracking failure, drastically reducing the service life of the motor. Epoxy also exhibits very good resistance to alkali as well as acids. Epoxy coating also allows for condensing humidity. The smoothly finished surface does not allow liquid water to stay on the windings

Available from size IEC 71 (0,25kW) up to size 250 (55kW), in 2-4-6 poles.

For the performance and dimensional data of delfire series, do not refer to the standard motors data contained in this catalogue. If needed, ask it to our commercial office.

EFFICIENCY

In order to create a common system for the classification of induction motor efficiencies, IEC (International Electrotechnical Commission) issued the norm IEC 60034 "Rotating electrical machines"

- Part 30-1: Efficiency classes of singlespeed, three-phase, cage-induction motors (IE-code)"-.

- Part 2-1: Standard methods for determining losses and efficiency from tests-.

In Europe it was a step ahead in the application of the Eco-design Directive for Energy- related Products (ErP) 2009/125/EC. It's based on such a normative picture and on the Ecodesign Regulation (EU) nr 640/2009, replaced in Oct 2019 by the Regulation (EU) 2019/1781, that:

- From June 2011, the efficiency of 2, 4, and 6 poles motors from 0.75kW up to 375kW lower than IE2 has been forbidden

- From 2015, the minimum efficiency for motors not equipped with an electronic variable speed drive from 7,5 to 375kW became IE3

	IE-1				IE-2			IE-3			IE-4

efficiency classes at 50Hz

- From 2017, the obligation of IE3 was extended to the motors not equipped with an electronic variable speed drive from 0,75kW to 5,5kW

We recommend to choose Motive VFD NEO or NANO

-From 1 July 2021:

the energy efficiency of three-phase motors $\ge 0,75~kW$ and $\le 1.000~kW,$ with 2, 4, 6 or 8 poles, rated for direct

on-line operation (DOL), including ATEX (only exception Ex e) and brake motors, shall correspond to at least the IE3 efficiency level; the energy efficiency of three-phase motors with a rated output \geq 0,12 kW and < 0,75 kW, with 2, 4, 6 or 8 poles, including ATEX and brake motors, shall correspond to at least the IE2 efficiency level;

-From 1 July 2023:

the energy efficiency of ATEX Ex eb with power $\ge 0,12$ kW and ≤ 1000 kW, with 2, 4, 6 or 8 poles, and single-phase motors with power $\ge 0,12$ kW shall correspond to at least the IE2 efficiency; the energy efficiency of three-phase motors which are not brake motors or ATEX motors, with power ≥ 75 kW and ≤ 200 kW, with 2, 4, or 6 poles, shall correspond to at least the IE4 efficiency

What did Motive do in this scenario?

- The measuring and calculation system of Motive motors efficiency is conform to the norm 60034-2-1. That's the one behind the data declared in the probative test-reports uploaded in motive web-site (each declared data, we remind it, is in fact supported, detailed and proven by by such test reports that anyone can download from:

https://www.motive.it/en/rapporti.php

- From June 2011, IE1 motors are not and it is submitted to ISO:9001 TUV produced anymore.

- IE3 "premium efficiency" electric motors are also available, and since 2023, IE4 "Super Premium Efficiency" motors as well. - all 3PH motors below 0.75kW are min also certified by CQC for IE2 "high efficiency"

- IE2 motors with power higher than 0.75kW are still available, but their use in Europe is forbidden in case of direct on line operation

- The testing system, test reports, and data truth of Motive motors has been certified by IMQ, the main Italian certification body for electrical appliances. The same, in fact, has firstly inspected and qualified our internal testing laboratory according to the norm IEC/ISO 17025, and then supervised the internal efficiency tests on a sampling list of motors. Motive testing laboratory and procedures has also been certified by RINA (Certificate No. 2015/MI/01/53).

Milan, September 30, 2008 Motive S.r.I. male, 110/112 Dear Mr Giorgia Basi-Herewith I confirm that Motive's laboratory, evaluated according to the requirements IECISO 17025, is found in compliance with main requirements of the above metric The following motors were tested according to standard IEC 60034-2 with antepervision rated power (kW) 90L-4 Em 1,5 100LB-4 Eff1 112M-4 Eff1 132M-4 Eff1 90L-2 Eff1 112M-2 Eff1 132SB-2 Eff1 4 7,5 2,2 112M-6 Eff 132S-6 Eff1 100LA-8 Eff1 132M-8 Eff1 3 0,75 Tel. the Chinese market.

Clients benefits are of many kinds:

BILL EFFECTS

.

.

é

.

.

•

6

.

2

The purchase cost of a motor is about 2-3% of the total costs of its life. The balance is energy consumption costs. Comparing IE3 motors to IE2, the purchase price difference is recovered in about one year of energy saving. Of course, such period length depends by the specific motor, the use of it and the local energy costs of each Country.

DURABILITY EFFECTS

Higher efficiency motors heat less, slowing down the aging cycle of the insulating materials and living longer.

The average life is approximately from 35 to 40,000 hours for IE2 motors up to 15kW and 60,000 for IE2 bigger motors. IE3 motors can live approx 40% longer than IE2 motors.

AMBIENT FEFECTS

Electric motors use 65% of all electricity

- in industry. Higher efficiency motors have
- the further objective of sustainable
- development, reduction of CO₂ emissions
- and consequent improvement of
- the quality of the atmosphere with an
- objective of sustainable development,
- Reduction of CO₂ emissions and consequent
- improvement of the quality of the

• • • Download our "Motive Energy Utility" App to calculate with your smartphone or tablet the energy saving bill effects by using a higher efficieny motor when replacing an old one.

Motive Energy Utility ė.

How to make a more efficient motor?

High efficiency can be seen in many ways: like the relation between output power and input absorbed power, or like a measure of the losses that born when converting the electric power in mechanical energy. From another perspective, high efficiency motors consume less energy to produce the

same torque on the shaft. Basically, an high efficiency motor is the result of precise machining, lower frictions, a dynamically balanced rotor, smaller space between rotor and stator and of the use of better materials. The main factors for the design are based on the choice of the type of lamination sheets and windings. Motive motors are made with "FeV" magnetic lamination sheets, rather than the customary iron lamination sheets.

Composition and thickness give to magnetic lamination sheets a very low W/Kg loosing factor.

Lower specific losses mean less magnetising current for the same Power and torque (thus less heating).

CE MARKING

(E marking is referred to:

Low Voltage 14/35/EC

10

EMC Electromagnetic Compatibility 14/34/EC

Eco-design Directive for Energy-related Products (ErP) 09/125/EC

Note: The Machinery Directive (MD) 2006/42/EC excludes from its scope the electric motors (Art. 1, comma 2)

CE marking is put by Motive as a visible sign of the product compliance with the requirements of above mentioned directives. In order to reach this conformity, Motive motors respect the following standards:

EN 60034-1 - EN 60034-5 - EN 60034-6 - EN60034-7 -EN60034-8 - EN60034-2-1 - EN60034-30-1 -EN50347 - EN61000-6-4 - EN 60034-9 - EN 60034-25

DELPHI EX SERIES

II 2G Ex eb IIC T3, T4, T5, T6 Gb II 2D Ex tb IIIC T85°C...T120°C Db

ATEX is the conventional name of the Directive 14/34/EC for the equipment intended for use in potentially explosive atmospheres.

Motive delphi Ex motors differ from standard delphi motors because they are designed to be used, like motive "Ex" gearboxes, in the ATEX zones 1, 2, 21 and 22

Motive delphi Ex motors are in fact certified for such zones according to the norms EN 60079-0 - EN 60079-7 - EN 60079-31 by a notified body.

Their certification covers all duty types, from S1 to S9, and also operation with inverters of any brand. In the latter case, Motive also provides its Ex forced ventilation system, which is likewise suitable for all types of dust and gas, in category 2.

The Delphi Ex series is also available in a version for environments with temperatures up to 60°C, while

still maintaining continuous duty S1 and an internal temperature of max 135°C (T4). The very high efficiency and low losses also help limit the surface temperature, still under S1 duty, to just 120°C. Nevertheless, it can be further reduced to 100°C and 85°C with intermittent duty.

Similarly, the internal temperature for gas can drop from T4 (135°C) to T5 (100°C) and T6 (85°C).

On our website, you will also find the EAC Ex certification for Eurasian countries, NEPSI Ex certification for China, and Ex certification for Ukraine.

Note: as stated by $T\ddot{U}V$ in the certificate, for each motor, configuration, and temperature class, the Motive website configurator shows:

• the minimum and maximum ambient temperatures

the admissible gas temperature classes

CCC MARKING

The electrical safety and the efficiency of Motive motors, with and without brakes, have been (certified by the CQC certification body, as required by Chinese laws, thus allowing them to be exported to China.

ПРОТОКОЛ ПСПЫТАНИЙ № 199-04/2020 от 14.04.2020 года EAC MARKING

The EAC certificate of conformity (EurAsian Conformity) indicates that Motive motors meet all the applicable technical regulations of the Eurasian Customs Union and that they can therefore be sold on the territory of the acceding countries (Russia, Belarus, Kazakhstan, Armenia and Kyrgyzstan)

The mark **[]** can consequently be found on the nameplate of Motive three-phase

MARINE MOTORS CERTIFIED BY RINA

In 2015 motive was admitted to the alternative test scheme (Certificate No. 2015 / MI / 01/537), which allows a more rapid and economical testing of three-phase marine motors compliant with RINA standards, both for essential service and not essential service.

In 2019 RINA also released the type design and validation tests certification for motive marine motors. In many cases this FREE certification is sufficient for the final customer, and therefore avoids the need to face the costs of the RINA test of each motor unit.

MOTIVE MOTORS PROTECTION

Protections must be chosen based on the specific running conditions, according to standards EN 60204-1

External protections

- Protection against overloads. A thermal cut-out relay, which automatically controls a knife switch.
- Protection against peak currents by magnetic relay that controls an automatic knife switch, or by fuses: these must be set to the locked rotor current.
- If the application requires, protection against excessive speed of the electric motor, for example if the mechanical load may drive the electric motor itself and thereby create a hazardous situation.
- If special conditions or synchronised operation with other machines or parts of machines require it. protection against power failures or dips by means of a minimum voltage relay that controls an automatic power knife switch.

Inner thermal overload cut-out switches

(per CEI 2-3/IEC 34-1)

The electrical protections on the motor power line may not be sufficient to protect against overloads. If the cooling conditions worsen, the motor overheats but the electrical conditions do not change, which inhibits line protections. Installing built-in protections on the windings solves this problem:

bimetallic device "PTO"

this is а normally-closed electromechanical device that opens when the threshold temperature reached; it is automatically

resets when the temperature falls below the threshold level. Bimetallic devices are available with various intervention temperatures and without automatic reset, per EN 60204-1.

PTC thermistor device

positively adiusts its resistance once the threshold temperature is reached.

Motive motors from size 160 to size 355L are equipped as standard with 3 PTC thermistors immersed in the winding.

PT100 device

sts its resistance according to the temperature. It is useful for constant measuring of the winding temperatures

SCHEDAPT motor thermal probes PTC+PT100 control card / interface

SCHEDAPT is capable of reading PTC thermistors or up to 3 PT100 probes, both for winding and for bearings

It allows to constantly monitor the motor temperature by reading the PT100 and/or PTC temperature probes inside the motor and to provide an output contact N.C. (normally closed by default) which, connected in series to the power supply of the external line contactor, will stop the power supply of the motor at an alarm temperature (130°C default setting by motive for PT100, editable, and PTC according to its own data) The casing, simple and compact, allows this device to be mounted on a DIN rail.

Supply voltage: 5 ÷ 30Vdc max 100mA.

All Motive motors shown in this catalogue are made for S1 continuous duty service, as per IEC 34-1 norm. The duty service class is shown on the rating plate.

DUTY SERVICE

Below are described the various types of service:

S1 - Continuous service: operating at constant load of duration N in order to reach a thermal balance.

IP PROTECTION INDEX

The protection against people accidental contacts and/or the entry of corps and/ or the entry of water is expressed at international level (EN60529) by a symbolic acronym composed by a group of 2 letters and 2 numbers.

RAIN SHIELD OR CLEAN FLOW FAN COWL FOR TEXTILE INDUSTRY

For outdoor applications with V5 - V18 - V1 - V15 installation, we recommend to mount a rain shield. This configuration may also be used in textiles processing industry.

IP index of protection reference letters

 $1^\circ\,$ num. Protection of people against contacts and protection against the entry of solid corps

 2° num. Protection against harmful entry of water

Motive motors are IP55 protected

TOTAL SEALING

Resin coated stator is a safe solution to the presence of very strong humidity or aggressive environments (for instance, carwash systems or chemical plants). It offers also a lower heating thanks to the thermal dissipation capacity of the resin.

The ideal combination is the resin-filled terminal box. In this case, according to the customer needs, the terminal block can be partially immersed, or totally immersed in such insulating and protective resin. In alternative, the terminal box and block can be taken off and the motor frame be closed by a sealed plate from which a cable can come out.

WORKING CONDITIONS

ASSISTED POWER COOLING

HUMIDITY:

The electrical equipment must be able to work with a relative humidity between 30 and 95% (without condensation). Damaging effects of occasional condensation must be avoided by adequate equipment design or, if necessary, by additional measures (for example, Motive offers anti-condensation heaters, drain holes, resin coated stators, and resin filled terminal boxes).

ALTITUDE AND TEMPERATURE:

the powers indicated are intended for regular use at altitudes below 1000 mt above sea level and a room temperature between + -15°C and +40°C (+100°C for delfire series)for motors having a rated power equal to or greater than 0.6 kW (IEC 34-1): For working conditions rather than those specified (higher altitude and/or temperature) the power decreases of 10% each 10°C of higher temperature, and of 8% for each 1000 mt of higher altitude.

It is not necessary to reduce the rated power if at an altitude higher than 1000mt and lower than 2000mt there is a max ambient temperature of 30° C or, in altitudes from 2000 mt to 3000mt there is a max ambient temperature of 19° C.

VOLTAGE - FREQUENCY:

The admitted variation of supply voltage and frequency is established by the norm EN60034-1 Within this tolerance delphi motors provide the rated power reported in the plate.

INSULATION:

The copper is impregnated with a double layer of H class insulating enamel to ensure high resistance to electrical, thermal and mechanical stress.

A NOMEX film that wraps entirely around the coil side insulates the copper and iron from one another.

The phases are further isolated by another layer of NOMEX to protect the motors from voltage peaks that usually occur when the motor is controlled by inverter.

In case that motors with more than 75kW are controlled by inverter, we suggest to request the

to open the electric circuit between the rotor and the motor frame, thus preventing that the

shaft currents go through the bearings and damage their balls surface and roll tracks.

The section "technical data" of this catalogue shows the max operating temperatures according to the Class insulation shown on the plate.

Delphi motors are designed to conserve wide margins against eventual overloads, having a temperature rise that is, at rated power, much lower than the operating temperature limit given by their insulation class. This fact increases considerably the motors life lenght. Such " Δ T" values are evidenced in the following per-

formance charts. (see further details about temperature rise in the "technical data" section of this catalogue) For application with a power supply at certain frequencies (see following graph), a power cooling system (IC-416) must be used.

Motive power cooling systems are three-phase 400/50 400/60, IP 55, and with separate terminal box. "Upon request, single phase, ATEX, 24Vdc and special voltage power cooling systems are also available."

ENCODER

Motors with incremental, absolute, profinet, profibus and ATEX encoders are available upon request. In this case, assisted power cooling is also available.

WIRING DIAGRAMS

Motive three phase motors can be connected "Star" or "Delta".

STAR CONNECTION

Star connection is obtained by connecting together the terminals W2, U2, V2 and supplying the terminals U1, V1, W1. The phase current lph and the phase voltage Uph are lph = ln Uph = Un / 1,74

where In is the supply line current and Un is the supply line voltage of Star connection

the following voltages and frequencies are inside the standard power supply of all motive 3PH motors, under S1 duty service:

		Volts				
Size	Hz	Δ	Å			
		230	400			
	50 ±5%	220	380			
		240	415			
56-132		260	440			
	60 ±5%	220	380			
		265	460			
		280	480			
		400	690			
	50 ±5%	380	660			
		415	720			
112- 355		440	760			
	60	380	660			
	±5%	460	795			
		480	830			

DELTA CONNECTION

Delta connection is obtained by connecting the end of a phase with the beginning of the following one. The phase current lph and the phase voltage Uph are repectively:

$$Ipn = In / I,$$

Uph = Un

where In and Un are referred to Delta connection. The star-delta start is the easiest way to reduce the current and the starting torque. The motors whose rated voltage in delta connection corresponds to the mains voltage can be stared with the star-delta method

For further wiring schemes with brake, 1PH, VFD, etc, download the manual from <u>https://www.motive.it/en/manuali.php</u>

THREE-PHASE SELF-BRAKING MOTORS SERIES DELPHI AT...

Delphi ATDC, AT24 and ATTD series self-braking motors use one or 2 spring-pressure brakes, firmly spliced onto a cast iron shield at the back of the motor.

These motors include a series of characteristics normally considered options by other brands, like:

-The standard hand lever permits to release the brake, making it possible to move manually he shaft,

-Thermal protectors embedded in the winding for all frame sizes. -Easy separate connection of the brake in case that the motor is connected to an inverter.

On ATDC and ATTD, the separate brake power supply is achieved, whenever needed, by connecting directly to the brake terminal board located inside the motor terminal box.

On AT24, the 24Vdc single or double brakes are designed to be directly connected to an inverter (usually having a 24Vdc plug)

On request, the brakes can be modified to be extremely silent for usage in special environments like theatres

IE2, high efficiency class IEC 60034-30-1

IE3, premium efficiency class IEC 60034-30-1

IE4, super premium efficiency class IEC 60034-30-1

The standard version has an IP55 protection index. Also available in IP56, IP65, and IP66 versions.

BRAKE DESCRIPTION

The delphi AT... series brakes are electromagnetic brakes with negative operation, whose braking action is exercised in the absence of power supply.

The brakes insulation class is F. The brakes lining is asbestos-free. The rectifier is of relays type, with protection varistors at the entry and the exit. All brake assemblies are protected against corrosion by painting or heat galvanizing and resined winding. The parts most subject to wear are treated in special atmospheres that provide considerable wear resistance to the parts.

BRAKE OPERATION

When the power supply is interrupted, the excitation coil ⑦ is no longer powered and therefore doesn't exert the magnetic force necessary to restrain the mobile armature ①, hwich, pushed by the pressure springs ②, compresses the brake disk ③ against the motor flange ⑥ on one side and the armature itself on the other, thereby creating a braking action.

S Air gap

ADJUSTMENT

On ATDC and ATTD motors bigger than size 90, two different types of adjustment are possible (download the technical manual from <u>https://www.motive.it/en/manuali.php</u>)

The braking torque is set to its max level by Motive, but it can be decreased by acting on the adjuster screws (*) (ATDC and ATTD motors) or on the knob (*) (AT24). Brake adjustment is only possible from size 90 L to size 280.

MANUAL RELEASE

IP

POWER SUPPLY

Motive brake motors are supplied with the manual release lever in their standard version. If not wished. the lever is like a screw. that can be taken away simply turning it.

ATTD tandem brake motors, from size 180 up to sized 280, cannot have the manual release.

Optional.

ATDC brakes are DC brakes power supplied by a rectifier installed inside the motor main terminal box.

The following tablechart shows the tensions on the rectifier and the brake of ATDC model

ATDC 63-100	inn 21201280 on	99 <u>-1</u> 26
ATDCT≬¢€-280	3805480	voltage1t2b6ake
	[Vac]	[Vdc]

quest of the client. motive supplies ATDC brake motors with the rectifier al-

ready connected directly to the main terminal block of the motor (fig. 1 and 2), in order to permit to the motor switching to act at the same time on the brake.

Unless there's a different re-

In case that the motor is power supplied by a frequency inverter (fig. 3), or at a special voltage*, or at a low tension during the start, or in case that the motor is used to move loads which can have an inertial movement, like lifted weights (such inertial movement can move the motor when the power is switched off, and the motor can act like a generator on the rectifier avoiding the brake locking), disconnect the motor main terminal board from the rectifier, and connect separately the rectifier (ATDC) (fig. 3 and 4).

TA special rectifier permits to solve the problem of inertial movements with no need for a separate power supply to the rectifier (fig 2)

This exclusive rectifier offers the following innovations:

- double semi-wave technology.
- special vibration proof 6 Ampere relays (like the ones used on Ducati race motorbikes).
- electric arcs ultra resistant contacts in silver alloy.
- relays system instead of normal mosfets system, thus more resistant against tension peaks, even if impulsive.
- an in-built current reading system which controls the current sinusoid and the relay commutation time.

What's the advantage? Rectifier is normally the "brain" and the fragile point of any dc brake motor. This rectifier is stronger against disturbs coming from power line, much stronger than what required by European EMC rules for industrial environment; they are more resistant against

STAINLESS STEEL BRAKING SURFACE

MICRO-SWITCHES TO DETECT BRAKE POSITION

Upon request, where humidity and intermittent service may cause early oxidation of the contact surface between the rear shield and the brake disc. a stainless steel cover can be added to the part of the rear shield in contact with the brake pad.

ATDC (separate 400Vac/180Vdc rectifier) + inverter (fig. 3)

ATDC _____+ separate 400Vac/180Vdc rectifier connection (fig. 4)

CONFIGURATOR

Configure what you need by this automatic consultant, and get CAD files and data sheets

Motive configurator allows you to shape Motive products, combine them as you want, and finally to download 2D/3D CAD drawings, and a PDF datasheet.

Search by performance

If you're not sure about the best products combination that you should select for your purpose, you can input your wishes, like final torque, final speed, use, etc, and the configurator will act like a consultant.

It will give you a list of applicable product configurations; you can then download a PDF data sheet featuring performance data and dimensional drawings for each configuration, as well as 2D and 3D drawings.

Search by product

To be used if you already know the product configuration that you want, and you just want to get quicker a PDF data sheet featuring performance data and dimensional drawings for 2D and 3D drawings.

free access without login <u>http://www.motive.it/configuratore.php</u>

DATI TECHNICAL DATA

The general electrical specifications are listed in the performance charts that follow. To understand their contents, the following general definitions are provided.

Cs

Rated Power:

it is the mechanical power measured at the shaft expressed, according to the latest indications of international Standards Committees, in Watts or Kwatts. However, in the engineering sector it is still common to refer to power in terms of HP

Rated Voltage:

the voltage to be applied to the motor terminals in accordance with the specifications in the following tables

Frequency:

All electrical data in this catalogue refer to three-phase wound motors at 50 Hz. These may be connected to 60 Hz, taking into account the multiplier coefficients in the table below

rated voltage at 50Hz	Volt at 60Hz	rated power W	ln (A)	Cn (Nm)	rpm	ls (A)	Cs (Nm)	Cmax (Nm)	2
$230 \pm 10\%$	230 ± 5%	1	/1	0,83	1,2	0,83	0,83	0,83	
$230 \pm 10\%$	230 ± 10%	10	0,95	0,83	1,2	0,83	0,83	0,83	
$230~\pm~10\%$	$240 \pm 5\%$	1,05	1	0,87	1,2	0,87	0,87	0,87	
$400~\pm~10\%$	380 ± 5%	1.1/17	1	0,83	1,2	0,83	0,83	0,83	
$400~\pm~10\%$	$400~\pm~10\%$	/ 1///	0,95	0,83	1,2	0,83	0,83	0,83	
$400~\pm~10\%$	415 ± 10%	1,05	1	0,87	1,2	0,87	0,87	0,87	
$400~\pm~10\%$	440 ± 10%	1,10	110	0,90	1,2	0,93	0,93	0,93	
$400~\pm~10\%$	$460 \pm 5\%$	1,15	1.4	0,96	1,2	0,96	0,96	0,96	
400 + 10%	480 + 5%	1.20		1//	1.2	1	1 1		

for further information, see chapter "wiring diagrams"

Synchronous speed:

is expressed in rpm and it is obtained by the formula f 120/p f= supply frequency Hz p= number of poles pairs

Rated Current:

"In" is the Rated Current, expressed in Ampere, absorbed by the motor when supplied at Rated Voltage Vn (V) and giving the Rated Power Pn (W) and it is obtained by the formula

 $\ln = \frac{Pn}{\sqrt{3} \cdot V_n \cdot \eta \cdot \cos \varphi}$ (A)

In the following tables, the rated currents are referred to a Voltage supply of 400V. For other voltage supplies the absorbed rated current can be considered inversely proportional ---to the voltage supply. EX:

			All and the second second		
Volt	230	380	400	440	690
In	1,74	1,05	1,00	0,91	0,64

Rated torque:

Cn is expressed in Nm, and it corresponds to the rated power and rated rpm. It is given by the multiplication of the force for the arm (distance) and it is measured in Nm because the force is expressed in Newton and the distance in metres. The rated torque value is obtained by the formula

Cmax

 $Cn (Nm) = Pn \times 9550 / rpm$ Pn= Rated power in KW rpm= rated rotation speed

Starting torque (or locked rotor torque): Cs is the torque that the motor can provide with the rotor at a standstill and the

rated power supply.

Cmax is the maximum

torque developed by the motor

at the rated power supply, at

a certain speed. It represents

also the value of the resistant

torque after which the motor

torque and maximum torque

charts, it is indicated the relation

between maximum torque and rated

Maximum torque:

Efficiency:

Cn

In

[%]

 η is expressed in % and it is given by the relation between the output Power and the addition of output Power and the electric losses of the motor, that is the input power absorbed by the motor. The electric motors losses are mainly of two kinds: for joule effect (rotor and stator) and iron losses.

The latest cause essentially heat. An higher efficiency means energy savings, lower heating, longer life of insulating materials. The smaller a motor is, the more the presence of a double lip oil seal as the ones used on the drive end of delphi flanged motors (B5 or B14) may affect, following the friction generated, performance. The motors B3 up to size 132, however, have V-rings with an almost non existent level of friction. For simplicity, the following

performance tables indicate the levels of absorption and performance measured on B14 motors for size 56 and B3 motors for size 63 and above.

Power factor or coso: it represents the coseno of the voltage and current gap angle.

Motive motors can face also temporary overloads, with Current increases of 1.5 times the rated current for at least 2 minutes.

Starting current (or locked rotor current): (you see diagram)

DATI TECHNICAL DATA

temperature rise ΔT :

The temperature rise " Δ T" is the change in temperature of the entire winding of the motor, including the wire placed deep inside the stator slots, when it is being operated at full load.

For example: if a motor is located in a room with a temperature of 40° C, and then is started and operated continuously at the rated power, the winding temperature would rise from 40° C to a higher temperature. The difference between its starting

temperature and the final inner elevated temperature, is the ΔT . Motive Delphi series motors are designed to offer a very low heating level, class B or lower, while their insulation system is at least class F (upgraded to class H for the Delfire series).

0					
				• • •	••
	-				
0-1	в (F	-	н	

Class	amb T (°C)	∆T (°C)	hot spot allowance (°C)	Tmax (°C)	
A	40	60	5	105	1
E	40	75	5	120	
В	40	80	5	130	5
E .	40	105	10	155	
Н	40	125	15	180	

example of overload capability (=life bonus) of an F class motor, with B class temperature rise

hot spot allowance ∆T T. amb.

> This extra margin gives the motor a "life bonus". As a rule of thumb, insulation life will be doubled for each 10 degrees of unused insulation temperature capability.

> The most common method of measuring the temperature rise of a motor is based on the differences between the cold and hot ohmic resistance of the winding.

The formula is:

 ΔT [°C] = (R2-R1)/R1*(234,5+T1)-(T2-T1) Where: R1 = Cold winding resistence in Ohms (just before that the test begins)

 $\begin{array}{l} R2= \mbox{ Hot winding resistance in Ohms (when the motor has reached its thermal equilibrium)} \\ T1= \mbox{ ambient temperature in °C when test begins } \\ T2= \mbox{ ambient temperature in °C when test is stopped} \end{array}$

To change ΔT from Centigrade to Fahrenheit: °C (ΔT) x 1,8

Note: The motor surface temperature will never exceeed the internal temperature of the motor, and will depend upon the design and cooling arrangements.

Noise:

The noise is expressed in dB(A). The measures must be taken in accordance with the standard ISO 1680-2, in order to find the Sound Power level LwA measured at 1m of distance from the perimeter of the machine. EN 60034-9 standard describes the acoustic Power limits to be respected, indicating the maximum sound power level LwA. The noise values indicated in the performance charts that follow are referred to a no-load motor working, supplied at 50Hz and with a tolerance of +3 dB(A).

The	moment	of inertia	a can	be	calculated	ir
this	way:	1 pm				
J =	(1/2) x M	x (R2)				

Where M [Kg] is the rotation mass, while R [m] is the ray of the volume at cylindrical symmetry.

TOLERANCES

The data of each motor are specified in this catalogue like requested by the norm IEC 34-1. This describes, in particular, the following tolerances:

mu		
111	Efficiency (Output Power input Power)	-15% di (1- η)
in	Power factor	1/ 6 di (1- cosφ) min. 0.02 max 0.07
nile cal	Locked rotor torque	-15% of the guaranteed torque +25% of the guaranteed torque
1	Maximum torque	-10% -of the guaranteed torque, if torque is not less than 1,5- 1,6 the rated torque
	Noise	+3dB

+10°C

Any 2D or 3D PDF datasheet, or 3D CAD model, with or without gearboxes, VFDs, and special executions, can be downloaded by https://www.motive.it/en/configuratore.php

NOTE: motors can be improved in any moment. The data in www.motive.it can be more updated. Each data is even more detailed and proven by the type test reports loaded in <u>https://www.motive.it/en/rapporti.php</u> Also the IE4 motors list is being increased constantly.

TERMS OF SALE AND GUARANTEE

ARTICLE 1 GARANTEE

1.1. Barring written agreements, entered into between the parties hereto each time, Motive hereby guarantees compliance of products supplied and compliance with specific agreements. The guarantee for defects shall be restricted to product defects following design, materials or manufacturing defects leading back to Motive.

The Guarantee shall not include:

- * faults or damages ensuing from transport., faults or damages ensuing from installation defects; incompetent use of the product, or any other unsuitable use.
- * tampering or damages ensuing from use by non - authorised staff and/or use of non - original parts and/or spare parts;
- * Defects and/or damages ensuing from chemical agents and/or atmospheric phenomena (e.g. burnt out material, etc.);routine maintenance and required action or checks;
- * Products lacking a plate or having a tampered plate.

1.2. Returns to credit or replace will be accepted only in exceptional cases; However returns of goods already used to credit or replace won't be accepted in any case. The guarantee shall be effective for all Motive products, with a term of validity of 12 months, starting from the date of shipment. The guarantee shall be subject to specific written request for Motive to take action, according to statements, as described at the paragraphs hereinbelow. By virtue of aforesaid approval, and as regards the claim, Motive shall be bound, at its discretion, and within a reasonable time-limit, to alternatively take the following action: a) To supply the Buyer with products of the same type and quality as those having proven defective and not complying with agreements, free ex-works; in aforesaid case, Motive shall have the right to request, at the Buyer's charge, early return of defective goods, which shall become Motive's property;

- b) To repair, at its charge, the defective product or to modify the product which does not comply with agreements, by performing aforesaid action at its facilities; in aforesaid cases, all costs regarding product transport shall be sustained by the Buyer.
- c) To send spare parts free of charge: all costs regarding product transport shall be sustained by the Buyer.
- 1.3 The guarantee herein shall assimilate and replace legal guarantees for defects and discrepancies, and shall exclude any other eventual Motive liability, however caused by supplied products; in particular, the Buyer shall have no right to submit any further claims. Motive shall not be liable for the enforcement of any further claims, as of the date the guarantee's term of validity expires.

ARTICLE 2 CLAIMS

2.1. Without prejudice to the application of provisions in Law, dated June 21, 1971, and as per Article 1:

Claims, regarding quantity, weight, gross weight and colour, or claims regarding faults and defects in quality or compliance, and which the Buyer may discover on goods delivery, shall be submitted by a max. 7 days of aforesaid discovery, under penalty of nullity.

ARTICLE 3 DELIVERY

3.1. Any liability for damages ensuing from total or partial delayed or failed delivery, shall be excluded.

3.2. Unless differently communicated by written to the Client, the transport terms have to be intended ex-works

ARTICLE 4 PAYMENT

4.1. Any delayed or irregular payments shall entitle Motive to cancel ongoing agreements, including agreements which do not regard the payments at issue, as well as entitling Motive to claim damages, if any. Motive shall, however, have the right, as of the payment's due date and without placing in arrears, to claim interest for arrears, to the extent of the discount rate in force in Italy, increased by 5 points. Motive shall also have the right to withhold material under repair for replacement. In the case of failed payment, Motive shall have the right to cancel all guarantees on materials, as regards the insolvent Client.

4.2. The Buyer shall be bound to complete payment, including cases whereby claims or disputes are underway.
